                                                                                                                                                                                                    A polypeptide which includes at least five amino acids from a fragment of the fibronectin A chain (R83679-84), C-terminal G domain of the laminin A chain (R83642/78) or NCI domain of the alpha-2 chain of type IV collagen (R83639-41) suppresses fibroblast, epithelial and glial cell proliferation, contraction of epiretinal membranes and cell migration within the eye. It may be used in the treatment of proliferative vitreoretinopathy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This polypeptide (designated IV-H1) corresponds to type IV collagen residues 1263-1277 from the major triple helical region of the alpha 1 chain type of IV collagen. It, or a polypeptide comprising this sequence, can be used to promote cellular attachment to substrata or to inhibit the metastasis and invasion of tumour cells.
                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                       Example 1; Page 29; 84pp; English.

They are composed of an adhesive peptide with a core sequence selected from: RGD (R70472-85), YIGSR (R70486-90) or other sequence (R82907-24), linked to a water soluble polysaccharide, preferably a water soluble dextran, at the C-terminus. The peptides are useful in inhibiting cancer metastasis, healing wounds and the regulation

Solid phase synthesis of triple-helical branched polypeptide under O-glycosidic bond and deuterium label retaining conditiwhich may contain collagen cell adhesion sequences, useful fostudying structure and biological activity of collagen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             W01135-40 are peptides, derived from laminin, fibronectin and collagen, which selectively remove glia cells in the presence of neurons. This enables analysis of behaviour of neurons in the absence of glia cells.
                                                                                                                                                                                                                                                                                                                                 W13022;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Selective remover for glia cells from neuronal cell cultures - useful for studying behaviour of neurons in the absence of glia

                                      sequence. This sequence is used to construct a peptide-amphiphile complex to exemplify the invention. The peptide-amphiphile complex of the specification comprises a lipophilic portion and a peptide portion having a secondary structure. The peptide portion preferably has biological activity, e.g. cell recognition activity or enzymatic activity. The complex may be used for forming stable lipid films on substrates, or may be used in bilayer membrane systems. It may, in micellar or vesicular form, be used in preparation of drug-targeting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present peptide is a collagen cell adhesion sequence (CCAS), known to promote adhesion and migration of various cells, comprising residues 1263-1277 of the collagen alphal(IV) chain. The triple helical polypeptide 2 (THP-2), which includes the present CCAS (residues 25-39) in its triple helix inducing region, was prepared by solid phase synthesis under O-glycosidic bond and deuterium label retaining conditions. THP-2 can be used to study the structure and biological activity of collagen.

                                                                                                                                                                     The present sequence represents an all D-form fragment of the continuous collagenous region of the major triple helical domain of the alpha 1 chain of human type IV collagen, designated D-IVHI. The peptide D-IVHI can be used to inhibit tumour cell binding to type IV collagen, inhibit tumour cell invasion of basement membrane and inhibit tumour cell metastasis in vivo. The peptide can be used to treat melanoma cell metastasis, and spontaneous Lewis lung tumour metastasis. The peptide is also useful for targeting cytotoxic agents and drugs to tumour cells.

                                                                                                                                                                                                                                                                                                                                                         This sequence represents a type IV collagen peptide. Ocular administration of the peptide inhibits fibroblast proliferation and can be used in the treatment of glaucoma. The peptide can be used to treat proliferative vitreorethnopathy by ocular administration of the peptides of the invention, which suppress fibroblast-mediated collagen gel contraction. The peptides can used for treating glaucoma in mammals, especially humans, by inhibiting intraocular fibroblast proliferation, fibroblast migration and scarring.

27-SEP-1995;
03-JUL-1996;
                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to supported polypeptides of formula:
A-B-B-(J)j-(U)u-L-R; where A = an N alpha-amino protecting group
removable under non-acidic conditions; B = an amino acid having a single
side-chain amino group protected with a group removable under non-strong
acidic conditions; J = an amino acid that is capable of acting as a
chromophore and is protected with a group capable of withstanding the
conditions under which the protecting groups of A and B are removed; U =
an amino acid; u = 0 or 1; j = 1 or more; L = a linker capable of being
labilised using a non-strong acid mechanism, and R = a support material.
The supported polypeptides are intermediates for triple-helical
polypeptides. The triple-helical polypeptides are useful for studying the
structure and biological activity of specific collagen sequences in homo-
                                                                                    Triple helical polypeptide; collagen; cell; adhesion; migration; promotion; alphal(IV) chain; solid phase synthesis; study; O-glycosidic bond; deuterium label; structure; biological activity; homotrimeric; heterotrimeric; nuclear magnetic resonance; NMR.
                                                                                                                                           Collagen alphal(IV) chain containing triple helical polypeptide 4.
                                                                                                                                                                 30-APR-1997
                                                                                                                                                                                        W13025
                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Supported polypeptide(s) useful as intermediates - for

THP-4 was prepared by solid phase synthesis under 0-glycosidic bond and deuterium label retaining conditions, without strong acidolysis steps which affect 0-glycosylation and isotopic labelling. THP can be used to study the structure and biological activity of particular collagens as homotrimeric or heterotrimeric forms, with the advantage that different adhesion sequences can be studied with a minimum of Gly-Pro-Hyp triplets, avoiding
                                                                                   W46046

                                                                                                                 The invention relates to supported polypeptides of formula: A-B-B-(J); (U)u-L-R; where A = an N alpha-amino protecting group removable under non-acidic conditions; B = an amino acid having a single side-chain amino group protected with a group removable under non-strong acidic conditions; J = an amino acid that is capable of acting as a chromophore and is protected with a group capable of withstanding the conditions under which the protecting groups of A and B are removed; U = an amino acid; u = 0 or 1; J = 1 or more; L = a linker capable of being labilised using a non-strong acid mechanism, and R = a support material. The supported polypeptides are intermediates for triple-helical polypeptides. The triple-helical polypeptides are useful for studying the structure and biological activity of specific collagen sequences in homoand hetero-trimeric forms. The present sequence represents a peptide intermediate used in the synthesis of a triple-helical peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        В
                                  The invention relates to supported polypeptides of formula:

CC A-B-B-(J)j-(U)u-L-R; where A = an N alpha-amino protecting group cremovable under non-acidic conditions; B = an amino acid having a single side-chain amino group protected with a group removable under non-strong caidic conditions; J = an amino acid that is capable of acting as a chromophore and is protected with a group capable of withstanding the conditions under which the protecting groups of A and B are removed; U = an amino acid; u = 0 or 1; j = 1 or more; L = a linker capable of being labilised using a non-strong acid mechanism, and R = a support material. The supported polypeptides are intermediates for triple-helical polypeptides. The triple-helical polypeptides are useful for studying the structure and biological activity of specific collagen sequences in homocam of the support of the supported polypentides are useful for studying the structure and biological activity of specific collagen sequences in homocam of the supported polypentides are useful for studying the structure and biological activity of specific collagen sequences in homocam of the supported polypentides are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and biological activity of specific collagen sequences are useful for studying the structure and support and structure and support and support and support and support and support and support and sup

THP-2 was prepared by solid phase synthesis under 0-glycosidic bond and deuterium label retaining conditions, without strong acidolysis steps which affect 0-glycosylation and isotopic labeling. THP can be used to study the structure and biological activity of particular collagens as homotrimeric or heterotrimeric forms, with the advantage that different adhesion sequences can be studied with a minimum of Gly-Pro-Hyp triplets, avoiding
                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; lung cancer associated protein; neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynecological; antipacterial; diagnosis; neural disorder; immune disorder; reproductive;

The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The proteins may be used to treat disorders such as neutral impure markers.
                       Isolation of DNA encoding alpha-5(IV)polypeptide of type collagen - to detect mutations in genes for alpha-5(IV) c which produce genetic or acquired basement membrane disore.g. Alport's syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases. Polynucleotide sequences F18425 - F18433 and peptide B58549 are used in the course of the invention for the identification and characterisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "interruption in Gly-X-Y sequence"

The protien contains the Gly-X-Y repeat coding sequence typical for collagenous proteins at one end and a typical NC-domain coding sequence at the other end. The sequence can be used to detect mutations in individual genes specific for this chain which can, directly or indirectly, produce several human diseases. It can also be used to determine genetic, e.g. Alport's syndrome, or acquired e.g. diabetes mellitus, disorders of the basement membrane, acquired e.g. diabetes mellitus, disorders of the basement membrane,

THP-2 was prepared by solid phase synthesis under 0-glycosidic bond and deuterium label retaining conditions, without strong acidolysis steps which affect 0-glycosylation and isotopic labelling. THP can be used to study the structure and biological activity of particular collagens as homotrimeric or heterotrimeric forms, with the advantage that different adhesion sequences can be studied with a minimum of Gly-Pro-Hyp triplets, avoiding

The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The proteins may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases.

Polynucleotide sequences F18425 - F18433 and peptide B58549 are used in the course of the invention for the identification and characterisation
Isolation of DNA encoding alpha-5(IV)polypeptide of type IV collagen - to detect mutations in genes for alpha-5(IV) chain which produce genetic or acquired basement membrane disorders e.g. Alport's syndrome

The protien contains the Gly-X-Y repeat coding sequence typical for collagenous proteins at one end and a typical NC-domain coding sequence at the other end. The sequence can be used to detect mutations in individual genes specific for this chain which can, directly or indirectly, produce several human diseases. It can also be used to determine genetic, e.g. Alport's syndrome, or acquired e.g. diabetes mellitus, disorders of the basement membrane, and as probes or antibodies against these nucleotide sequences. Gene fragments generated through amplifications from human genomic or cloned DNA can also be used for detection and analysis of genes.

It includes a complete non-collagenous domain that shows 83% identity with that of alpha1(IV) and 63% with that of the alpha2(IV) chain. Mutations in the alpha5(IV) gene (COL4A5) are associated with Alport's syndrome. Antibodies raised against a peptide (see also W09644) specific to alpha5(IV) can be used in the diagnosis of basement membrane disorders such as Alport's syndrome.
                                                                                                                                                                                                                                                                                                                                                                                cardioactive; dmmunomodulatory; muscular active; vulnerary;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antagonists may have neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antiinfective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated polynucleotide sequences may be used for detection of lung cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The proteins may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds and infectious diseases. Polynucleotide sequences r18425 - r18433 and peptide B58549 are used in the treatment of the invention for the identification and characterisation of the invention for the identification and characterisation.
                                                                                                                                                                                                                                                                         Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    associated proteins represented in B58106 - B58548. Lung cancer associated proteins and polynucleotide sequences, their agonist
                                                                                                                                                       Region
                                                                                                                                                                                                                                                                                                                 Region

The alpha-6(IV) protein can be used for diagnosis or gene therapy of diseases associated with collagen type IV pathology, especially Alport's syndrome and associated diffuse leiomyomatosis. The polypeptide may also be used for generating monoclonal or polyclonal antibodies having specificity for the alpha-6(IV) polypeptide especially an antibody that is not crossreactive with other collagen proteins including alpha-1(IV), alpha-2(IV) and alpha-5(IV) collagens.

                                                The present sequence is that of human type III collagen alpha-1. The invention is based on the discovery function is based on the discovery particular collagen fragments in body fluids of patients compared with those of healthy subjects. These fragments are generated with those of healthy subjects. These fragments are generated upon collagen degradation and are partly characterised by the
presence of potential sites for crosslinking. A method for assaying collagen fragments in a body fluid sample is based on the competitive binding to immunological binding partners of collagen

                                                                                                                                                                                                                                                                                                                                                                                                                                             Kit for detecting genetic pre-disposition for vascular aneurysms - contains primer to amplify portions of Type III procollagen DN and detects mutation in standard procollagen DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fragments in the sample and of synthetic peptides derived from collagen and containing crosslinkable sites (see y96118-21). When considering the degradation of type III collagen, the assay can be used as a means of identifying the presence of vasculitis syndrome.

This fragment was then used to a bovine lens cDNA library and a 1.5 kb partial cDNA clone was obtd. (clone KMC15). This encodes 238 residues of the triple helical collagenous domain and all 233 residues of the C-terminal non-collagenous (NC1) domain of the alpha 3 (IV) chain. An isolated and substantially pure nt. having the sequence in Q96290 is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cDNAs encoding human or bovine alpha-3 type 4 collagen peptide(s) useful for detection and therapeutic removal of antibodies associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a recombinant bovine alpha3 chain of type IV collagen polypeptide. The sequence corresponds to the 238 amino acids of the C-terminal end of the triple helical domain and all 233 amino acids of the C-terminal non-collagenous domain. Alpha3 chain collagen polypeptides are useful for detecting Goodpasture antibodies in blood or tissue from a human patient and for treating Goodpasture syndrome, especially by neutralising the antibodies in the blood. The polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Column 31-34; 27pp; English

                                                                                                            A method has been developed for the detecting liver disease. The method comprises: (a) reacting a patient sample with antibodies (Ab) specific for collagen type XVIII (Coll8); (b) measuring the amount of Ab-antigen complex (C) formed as indicator of the amount of Coll8 present; (c) similar analysis of a non-diseased control; and (d) comparing the amounts of Coll8 in the two samples to detect presence or progression of disease. Elevated levels of Coll8 are: (i) indicative of disease, specifically cirrhosis; and (ii) predictive of the prognosis of disease, specifically hepatocellular carcinoma (there is a relationship between coll8 mank levels and tumour size and necrosis, and survival times are significantly higher in patients with higher Coll8 levels). The method provides non-invasive, early and accurate diagnosis of liver disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosis and monitoring of liver disease by measuring collagen type XVIII levels - with elevated levels indicative of disease, especially cirrhosis or hepatocellular carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Clement B,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        in the fluid of a patient by contacting it with a peptide comprising a most 218 amino acids of the human alpha3 chain type IV collagen that contains the fragment shown in Y56785. The methods are useful for the diagnosis and treatment of Goodpasture syndrome. The present sequence represents the bovine alpha3 chain of type IV collagen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 6; Fig 8; 56pp; English

   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score
